# Uikit

A front-end framework that offers core objects and features that are ideal for iOS and tvOS apps. It gives the ability to display content through the objects, as well making it easy to interact through the features. To utilize the the frame work we inserted the css stylesheet that was pre-made into our code.

- Inserting certain images through the Uikit feature became difficult.

# Our Experience with Uikit

Overall our experience with Uikit was beneficial. It made creating a site more time efficient and organized. Rather than making our code all the components our site we were able to paste in several markups for different features and customize it to our liking.
